Research Interests

My research interest lies in the intersection between cybersecurity and systems. My research mission is to bring **systems security and cost efficiency into large-scale, emerging/evolving infrastructures and applications**. 1) On the cyber-security front, I am interested in applying formal methods, protocol analysis, automated program analysis, and software testing techniques to discover vulnerabilities, detect attacks, and design secure systems. I am also interested in the security-oriented measurement of large-scale systems. 2) On the systems front, I am interested in integrating security solutions into an overall functional system while meeting requirements in performance, cost-efficiency, and others. I am also interested in workload analysis, benchmarking, design of optimization schemes, and middleware systems.

My recent research focuses on decentralized systems like public blockchains. I tackle the systems security/efficiency challenges at different blockchain layers, including DeFi protocol design, smart contracts, consensus protocol implementations, P2P networking, and web3.0 infrastructures. I am particularly interested in discovering and fixing design flaws in blockchains and DeFi applications using formal methods. Besides the basic research, I am developing/disseminating blockchain educational materials. In the past, I worked on confidential computing, trusted execution environments, applied privacy-preserving protocols, and cloud security.
